

IN THE CLAIMS

1-74. (canceled)

75. (new) An electronic device, comprising:
a plurality of integrated circuit packages;
a contact surface electrically connected to each of said packages; and
an integrated circuit package support extending from said surface and in contact with each integrated circuit package, wherein the integrated circuit packages extend from the surface by a first distance and the support extends from the contact surface a second distance.

76. (new) The device of claim 75, wherein each of said packages is contacted on its upper end.

77. (new) The device of claim 75, wherein said support includes a pair of surfaces which engage each of said packages on two opposed surfaces, sandwiching said packages.

78. (new) The device of claim 77, wherein said support is resiliently biased against the sides of said packages.

79. (new) The device of claim 78, wherein said support contacts the side edges of said packages.

80. (new) The device of claim 75, wherein said support is made of a heat conducting material.

81. (new) The device of claim 80, wherein said material is a conformal material.

82. (new) The device of claim 80, wherein said material is

a foam having heat conductive particles dispersed through it to increase its heat conductivity.

83. (new) The device of claim 79, wherein said support includes outwardly extending tabs arranged to engage depressions in said packages.

84. (new) The device of claim 77, wherein said support is made at least in part of plastic foam.

85. (new) The device of claim 84, wherein said support is made of plastic foam with a plurality of slots formed therein, each slot sized to resiliently engage one of said modules.

86. (new) The device of claim 85, wherein said foam includes adhesive on its bottom to secure said foam to said surface.

87. (new) The device of claim 75 wherein the extent to which the support contacts the integrated circuit package is a third distance that is either equal to less than the second distance and less than the first distance.
